Quick Response Controller
Powered by Heatcraft
Sales Brochure
Product Overview

The Heatcraft Quick Response Controller is a factory installed and tested control solution that provides automatic superheat and intelligent defrost control for refrigeration unit coolers. Utilizing innovative, state-of-the-art technologies, the Quick Response Controller delivers reliable operation and system performance while saving energy compared to traditional electro-mechanical refrigeration controls.

The Heatcraft Quick Response Controller combines electronic expansion valves (EEV’s), superheat control, defrost algorithms and fan cycling that result in faster temperature pull downs, stable operating temperatures and overall energy efficiency.

When you order a new unit cooler equipped with the Heatcraft Quick Response Controller you can be certain that you are ordering one of the most complete, reliable and efficient controls solution available in the market today. Remote refrigeration monitoring of one or more systems is an optional feature available with the Quick Response Controller.

FACTORY INSTALLED AND TESTED

Ease of Installation
- Pre-assembled controls package
- No installing or connecting components
- Reduced time and effort required for installation
- System will work optimally out of the box

Stand Alone
- No low voltage wiring between condensing unit and evaporator
- Complexity and volume of electrical wiring decreased
- Faster installations and easier troubleshooting

Built by Experts
- Same technical expertise used to design refrigeration equipment and the controls
- Precise engineering and systems integration allow for optimal performance
**INTELLIGENT DEMAND DEFROST**

Intelligent
- Many years of experience and knowledge harnessed to develop the Heatcraft Quick Response Controller
- Result is a controller that’s ready to analyze and adapt to constantly changing conditions

Demand Defrost
- Continuously evaluating system parameters, pressures, temperatures and valve position
- Executes a defrost cycle only when actual conditions warrant
- Results in overall energy savings, more consistent box temperatures and improved product integrity

---

**RAPID RESPONSE – ELECTRONIC EXPANSION VALVE (EEV)**

Improved Temperature Control
- Designed to maintain product or process temperatures within a specific range
- EEV’s will allow system to reach optimal conditions faster
- Greater control over system temperatures

Precise
- Traditional thermostatic expansion devices (TXV’s) take time and expertise to properly setup
- Ideal settings already exist in the algorithm with an EEV
- Select the desired superheat and refrigerant type, the controller will automatically make necessary adjustments

Rapid
- Achieving and maintaining ideal superheat ensures equipment responds rapidly following compressor startup
- Refrigeration systems that balance out quickly, adapt to changing conditions faster

---

**Superheat in Pulldown**

- Designed to maintain product or process temperatures within a specific range
- EEV’s will allow system to reach optimal conditions faster
- Greater control over system temperatures

---

**Initiated Intelligent Demand Defrost**

Day 9 – Defrost Cycles Reduced by 75%
