(Replaces AH-91C)

Air Handlers

Tech Bulletin

For Air Conditioning, Heating and Ventilation

Available in Bohn™, Climate Control™, Chandler™ & Larkin™

Models HCS, HCL
VCS, HD
Size 03 thru 75

VCS MODELS 03 - 41
11 Standard Models
Capacities From
1000 to 24000 CFM

Quality Standard

Heatcraft has built high performance air handlers for the building trade for over forty years.

Our hallmark has been a continuing process of design improvements to keep pace with new system requirements. This bulletin presents the complete line of air handling units offered by Heatcraft for air conditioning, heating, and ventilation applications.

Customers can specify brand at time of order, available in Bohn, Climate Control, Chandler and Larkin.

Index

Quick Cues for the five cabinet styles:

S	= SHORT	in model HCS
L	= LONG	in model HCL
V	= VERTICAL	in model VCS
HD	= HEATING DUTY	in model HD

Our highest design priorities are for units with low operating costs, rugged construction, and the features most needed for simple trouble free installation and maintenance.

Heatcraft Refrigeration Products' ISO 9000 certification guarantees consistent quality products for you and your customers.

Nomenclature

Cabinet style	HCL	06	FC	Fan Type:
HCS — (S for Short) Insulated fan section with motor base and access door(s), horizontally adjacent (same elevation) with insulated short depth coil section with drain pan.				FC - Forward curved fans, available with all cabinet styles, sizes 3 thru 41
HCL — (L for Long) Insulated fan section with motor base and access door(s), horizontally adjacent (same elevation) with insulated long coil section with drain pan.				AF - Air foil type fans, available with sizes 20 thru 75, all cabinets except VCS style
VCS — (V for Vertical, fan on top of coil section) Insulated fan section with motor base and access door(s), vertically adjacent to (on top of) insulated AHV coil section with drain pan.				Nominal coil face area (square feet): Size 03 thru size 75 See inside back cover for actual coil face area for each model size.
HD — (HD for Heating Duty) Uninsulated fan section with motor base and access door(s), horizontally adjacent (same elevation) with 1, 2, 3, 4 or 6 row heating section.				

Standard Features, Basic Cabinet Models Per Unit Size

'S' = Standard 'A' = Available

Basic Cabinet

Consists of a fan section and a coil section with double wall drain pan. The housing panels are die formed from mill galvanized steel and insulated with 1" - 3/4 pound density mat faced fiberglass insulation. All fan sections have hinged and latched access doors. Unit below has fan and coil section.

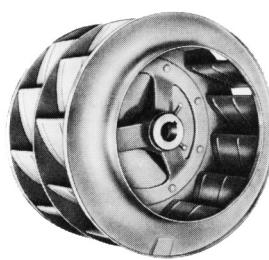

Fans

All units have single, double width, double inlet fan wheels for quiet performance and low energy consumption. Single wheels eliminate the problem of unequal loading which is characteristic of units with multiple wheels. Also, the expense of a "pants" type duct connection is avoided. Sizes 03 through 41 units have forward curved and size 50 through size 75 units have airfoil fan as standard.

Forward
Curved Fans

Air Foil
Fans

Bearings

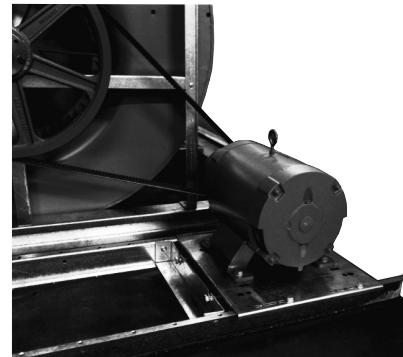

Unit sizes 03 through 12 have lifetime lubricated fan bearings as standard. Unit sizes 03 through 12 with optional medium pressure fan have pillow block bearings rigidly supported on a heavy steel frame. Unit sizes 14 through 75 have pillow block bearing rigidly supported on a heavy steel frame as standard. The bearings are self aligning and are selected for an average service life in excess of 200,000 hours. There are extended lube lines and grease fittings on the drive side of all units that have pillow block bearings. The bearings on these models can be lubricated without opening the blower section access door. Maximum operating temperature is 140°F.

Fan Shaft

The fan shaft is solid polished steel, and keyed for both fan and drive. It is designed so that critical speed is at least 1.25 times the maximum operating speed.

Motor Mount

Heatcraft puts the motor inside the fan section cabinet. It is mounted on a heavy gauge steel slide rail base. There are several advantages with internal motor location. It eliminates the need for a bulky belt guard. Another advantage is that Heatcraft balances the factory mounted motor and drive components, which can eliminate additional balancing at start-up.

Coil Section

Coil sections cover a wide range of heating and cooling requirements. Side, top and bottom panels are 16 gauge mill galvanized steel. All coil sections accommodate either small or large face area coils.

The HCS coil section will hold 15 1/2" of coils and spacers. The HCS section covers most applications. Use the HCL coil section if the coil or access space is more than 15 1/2". (See page 38 for maximum per model.)

Cooling coil sections have a drain pan with double wall construction. Insulation is sandwiched between the outer panel and the inner drain pan. The pans are heavy gauge mill galvanized steel. Heatcraft welds the corners of the drain pans and puts drain connections on both sides of the coil section for field convenience. The coils sit in an upright position inside the coil section. The air flows horizontally through the coils. Larger models (sizes 50 through 75) have cooling coils stacked two high. These larger models come with an intermediate drain pan, so that condensate from the upper coil does not flow over the lower coil.

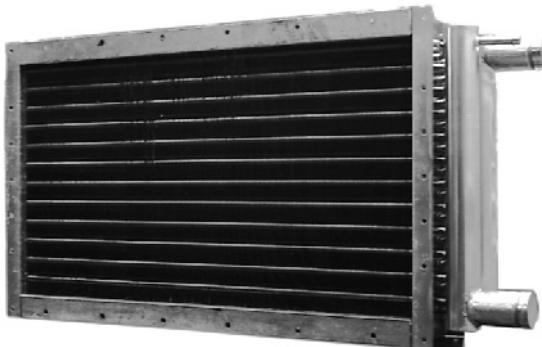

Coils come in either small or large sizes (pages 42-43). A large face area coil fills the total face area of the coil section. The coil section's total air volume passes through the large coil. A small coil is shorter in height and does not fill the total face height of the coil section. Air may bypass above the coil through balance dampers or internal face and bypass dampers. With either combination, it is possible to adjust and control the amount of air passing through the small size coil.

Chilled water and direct expansion coil face velocities over 550 FPM should be avoided--WATER CARRYOVER.

If desired, a blank off plate above the small coil can force total coil section air volume through the small coil.

There are a wide variety of coil types to meet the load requirements of conditioned spaces. Heatcraft's four coil types are: water, direct expansion, heat reclaim and steam coils. All standard coils have copper tubes and aluminum fins and a heavy gauge mill galvanized steel casing. Staggered tube designs increase air turbulence and improve coil performance. The plate type, die formed, corrugated fin design provides optimum strength. The fin design also enhances air turbulence for peak performance. Each fin has die formed, self-spacing fin collars which completely surround the tubes. Heatcraft mechanically expands the tubes into the fins to provide maximum heat transfer. Fin spacing selections of six to fourteen fins per inch insure that an optimum coil is offered to meet specific design needs.

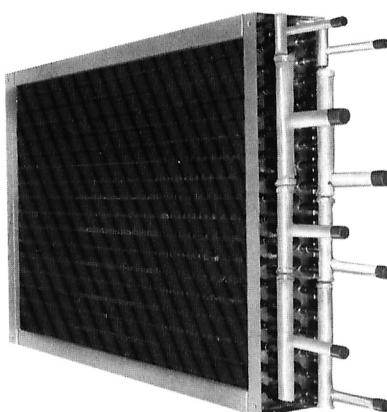

Water Coils

Direct Expansion Coils

Select direct expansion coils from 3, 4, 5, 6, or 8 row coil depth options. All direct expansion coils offer five fin densities (6, 8, 10, 12, or 14 FPI). Specify either 1/2" (Type A) or 5/8" (Type 5) tube diameters. Each coil has a brass, sweat connection type distributor and copper suction header. Distributor leads of equal length work for equal refrigerant distribution to all the circuits. Working with Heatcraft software or your representative, select from a among variety of circuit designs. Heatcraft has an optimum design to deliver the proper refrigerant pressure drop for your conditions. Specify multiple distributors for face split or row split control of the coil.

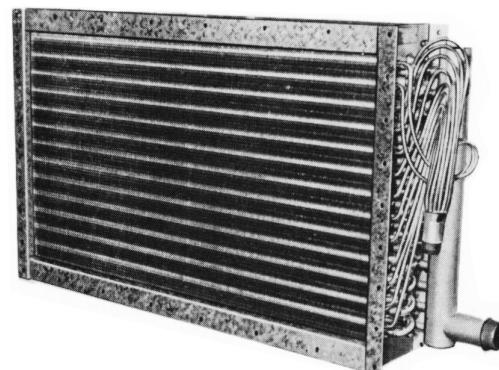

Condenser Heat Reclaim Coils

Nonfreeze Steam (NFS) coils have internal steam distributing tubes which are directionally lanced for high performance and good condensate removal. The coils are also pitched in the coil casing. The design working pressure and temperature of standard copper tube coils are 150 PSIG and 366°F. respectively. Depending upon job requirements, select the 5/8" (Type 5) tube diameter coil at an optimum fin spacing and a one or two row coil depth for air handler model sizes 03 through 50. For models 65 and 75, select the 1" (Type 8) tube diameter coil with one row at an optimum fin spacing.

Water Coils

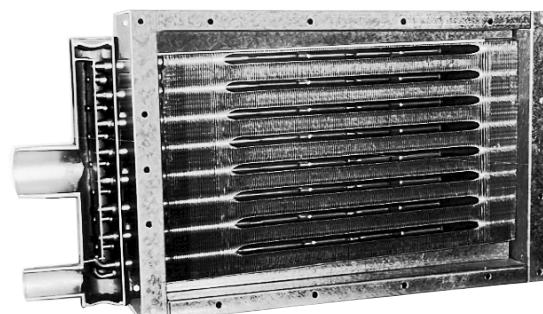

A wide range of choices leads to the best coil selection for each particular job. Select water cooling coils from 4, 5, 6, or 8 row coil depth options. Select water heating coils from 1, 2, or 3 row coil depth options. All water coils offer five fin densities (6, 8, 10, 12, or 14 FPI). Specify either 1/2" (Type A) or 5/8" (Type 5) tube diameters. Heatcraft optimizes circuit design from the header into the coil and delivers high internal heat transfer coefficients for each application's conditions. This is done without resorting to internal devices which increase pressure drop or restrict draining. All circuit designs avoid trapped circuits, so the coil is drainable. There are vent and drain connections on both supply and return headers on coils of 3 or more rows. All coil connections terminate outside the air handler coil section cabinet. Design working pressure is 250 PSIG. Design fluid temperature for heating coils is 300°F.

Direct Expansion Coils

Heat Reclaim Coils

Refrigerant Heat Reclaim (RHR) coils with multiple circuits handle applications where a number of refrigeration compressors are connected to a single coil. Each circuit has heavy wall copper, sweat type, hot gas inlet and liquid or cooled gas outlet connections. Heatcraft's custom coil circuiting maintains an internal coil pressure drop below 5 PSIG for each system. Depending upon job requirements select 1/2" (Type A) or 5/8" (Type 5) tube coils, select one of five fin densities (6, 8, 10, 12, and 14 FPI), and select from coil row depths of 2, 3, 4, 5, 6, an 8 rows.

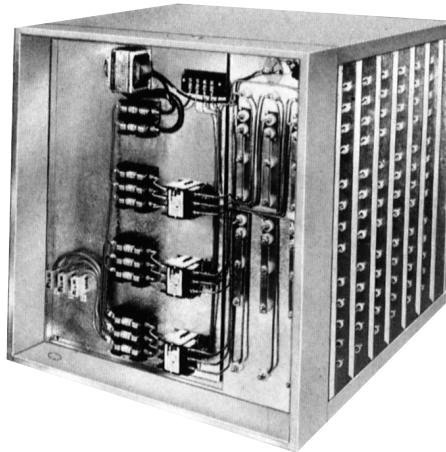

Steam Coils

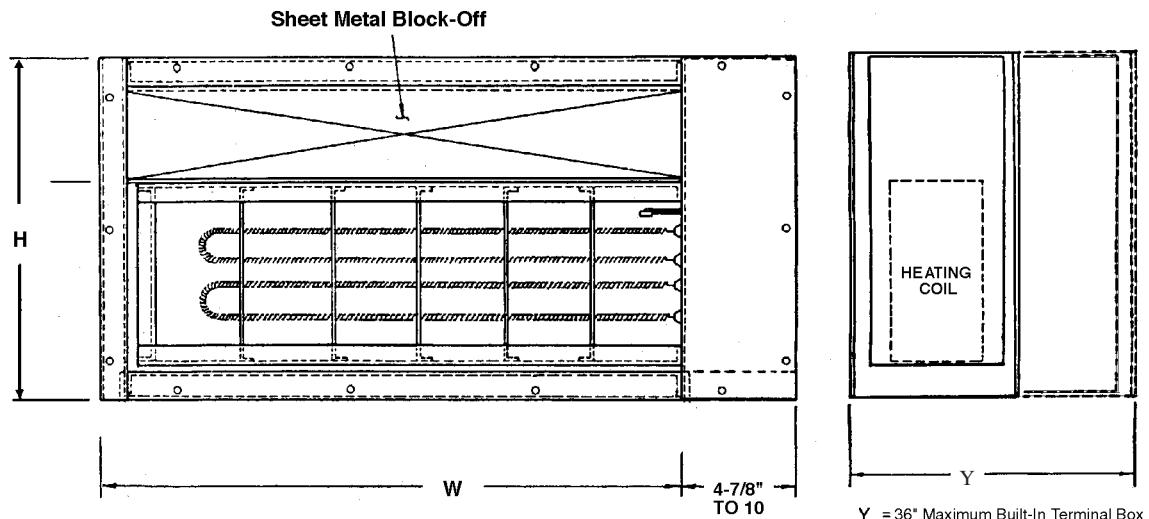

Electric heaters are UL listed for duct installation. The UL label applies to the heater only, not the complete air handler.

Heaters are furnished as a separate section and are available with insulated or uninsulated casings. Controls such as contactors, fuses, etc., may be factory installed and wired in the heater section end panel provided the number of control steps is not excessive.

Remote control panels are also available.

Construction & Dimensions

Unit Size	Heater Dimensions (In.)	
	H	W
03	22 3/4	30 5/8
06	26	45 5/8
08	35 1/2	42 5/8
10	35 1/2	51 5/8
12	38 3/4	57 5/8
14	38 3/4	66 5/8
18	47 3/4	66 5/8
20	44	83 5/8
26	44	108 5/8
34	54	108 5/8
41	65	108 5/8
50	74 3/4	110 7/8
65	82 3/4	126 7/8
75	94 3/4	126 7/8

1. Total KW Needed

$$\text{Approximate KW} = \frac{\text{CFM} \times \text{TD (F)}}{3000}$$

2. Number Of Steps Recommended

Rule of thumb for calculating the recommended number of steps required. Use Step A or B below, whichever is higher.

$$\text{A. Number of Steps} = \frac{300 \times \text{Total Heater KW}}{\text{CFM}}$$

(Based on approx. 10°F. temp. rise per step)

$$\text{B. Number of Steps} = \frac{\text{Total Heater KW}}{\text{Maximum KW per step}}$$

Notes: Heaters for constant volume units to have 35 W/in² of wire surface maximum.

The standard electric heater section construction includes:

1. Automatic thermal cutout
2. Heat limiters
3. Air flow switch

Typical options for the electric heater section are:

1. Fiberglass insulation in cabinet
2. At least one magnetic contactor per step of heating (two or three pole break)
3. Three phase fuse blocks and fuses
4. Transformer with primary fusing
5. Manual reset thermal cutout in control circuit

Maximum KW per contactor and per fuse block (at least one contactor is required per step of heating):

Component	Maximum KW			
	208 V	240 V	460 V	480 V
Low amps contactor	9.0	10.4	19.9	20.8
High amps contactor	17.3	19.3	38.2	39.9
Fuse block	17.3	19.9	38.2	39.9

Electric Heater Selection Example

- A. How many KW is needed to increase temperature of 17000 CFM by 27 °F for Air Handler Model Size 34?

$$\frac{17000 \times 27}{3000} \text{ is: } 153 \text{ KW IS REQUIRED}$$

- B. How many steps required at 10°F rise per step?

$$\frac{300 \times 153}{17000} \text{ is: } 2.7 \text{ STEPS ROUNDS UP TO 3 STEPS}$$

- C. How many steps required at 460 volts with low amps contactors?

$$\frac{153}{19.9} \text{ is: } 7.7 \text{ STEPS ROUNDS UP TO 8 STEPS}$$

- D. How many steps required at 460 volts with high amps contactors?

$$\frac{153}{38.2} \text{ is: } 4.0 \text{ STEPS}$$

- E. How many fuse blocks required?

$$\frac{153}{38.2} \text{ is: } 4.0 \text{ FUSE BLOCKS}$$

- F. Order the 153 KW to get the 27 degree rise.

Throw out the 3 steps (figured at 10°F. rise in part B), because it is smaller than the two values figured per contactor size (parts D & E). Decide whether you want high amps or low amps contactors, if you want low amps contactors, round the 7.7 to 8 and order 8 of the low amps contactors (you now have a possible 8 steps of control). If four steps of control are satisfactory, order the high amps contactors. In either case, the application requires four fuse blocks (part E).

Notes:

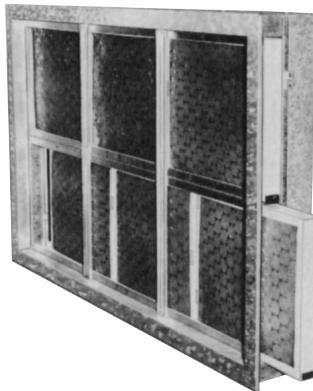

1. You must order the split shipment of the fan and coil sections to get electric heat on unit size 03 through unit size 18.
2. All electric heat controls are built into the heater control box.
3. Specify two pole break contactors or three pole break contactors. Two pole contactors only de-energize, while three pole contactors disconnect.
4. Be aware of requirements for heater circuits rated more than 48 amps. According to N.E.C. Code and U.L. you must subdivide the heater elements of such circuits. N.E.C. Code requires that the sub-circuit fuses be furnished by the heater manufacturer.

Commonly Used Control Systems:

- A. For small loads (up to 20 KW), consider a multi-stage thermostat.
- B. For medium loads (up to 200 KW), consider a modulating thermostat that operates a step controller.
- C. For fine control of large loads (above 75 KW), consider a combination step control and SCR vernier system. This scheme has 80% of heater capacity controlled by conventional step controller, with the other 20% on a solid state SCR controller.
- D. For 100% proportional control of any size, consider a total SCR control.
- E. Heatcraft does not supply :
multi-stage thermostats
modulating thermostats
But you will want to order contactors and fuse blocks from Heatcraft that are appropriate for the control scheme specified in the field.

Flat Filter Sections

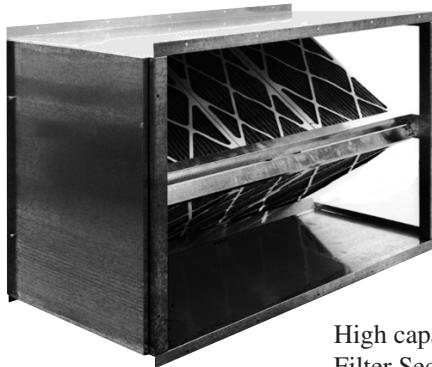

Flat filter sections are space saving and economical. Choose either two inch or four inch filters. The two inch filters can be the throwaway, the 35% pleated, or the high velocity cleanable type. Four inch filters are 35% pleated, they have more filter surface than two inch filters. Four inch filters impose less static on air flow and do not need to be changed as often as two inch filters. The filters slide into metal channels and are removable from either side of the section.

Flat Filter Section

High Capacity Filter Sections

Designed for high air volume applications. Filters are arranged in a V or W pattern for the greatest surface possible which provides extended filter life and reduced resistance to air flow. This means less fan horsepower. The sections have access doors on each side to ease filter change.

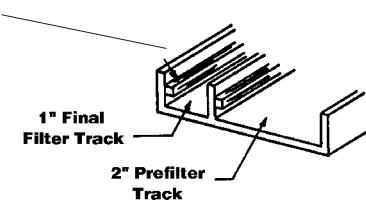

High capacity Filter Section

High Efficiency Filter Sections

Select 22", 28", or 44" bag filter sections. Choose medium or high efficiency bag or cartridge filters for this section. See pages 9, 29, 42, and 43. Sections are complete with prefilter and bag filter tracks. The sections have an extruded aluminum final filter track with a reinforced nylon pile seal. The positive seal forces the air flow through the high efficiency final filter.

Extruded Aluminum Filter Track
Final Filter Tracks Have Reinforced Nylon Pile For A Positive Seal

Mix Box Sections

The Mixbox is an entering air section. Typically, the mixbox accepts air from two sources. Many system designers economize performance by varying the two air flows to deliver conditioned air with minimum energy consumption. Mixbox sections are constructed with heavy gauge mill galvanized steel. Select from three inlet opening locations: the air can enter through openings at the top, at the back, or at the bottom of the section. Order the mixbox with or without dampers. The section with dampers has parallel blades at each opening and an interconnecting linkage between the openings. The damper rods rotate in frictionless sleeve bearings, and the drive rod extends from both sides of the section for either left or right hand drive.

Mixbox

Face And Bypass Dampers

For damper applications, choose either the internal face and bypass section or the external face and bypass section. If used with a large coil the damper section must be the external face and bypass damper type. When used with a small coil, select the internal face and bypass damper section. The damper sections have balanced opposed blades with interconnecting linkage. The blades positively lock to the damper shafts. The shafts rotate freely in frictionless sleeve bearings.

Face and Bypass Dampers

Filters And Auxiliary Sections
(see pages 42 and 43 for number and quantity of filters per model)

Flat and High Capacity Filter Sections- All Unit Sizes:

(Dimensions, Page 29 to 37)

2" flat filter section with choice of three standard filter types:

- 2" throwaway filters
- 2" 35% efficient pleated filters
- 2" permanent high velocity cleanable filters

4" flat filter section:

- with 4" 35% efficient pleated filters

High capacity filter section with choice of three standard filter types:

- 2" throwaway filters
- 2" 35% efficient pleated filters
- 2" permanent high velocity cleanable filters

High Efficiency Filter Sections- All Unit Sizes:

(Dimensions, Page 29 to 37)

Prefilters: select either 2" throw-away or 2" 35% efficient filters as prefilters. All three high efficiency filter sections accept prefilters, without reducing final filter depth capacity.

- 2" high efficiency filter section (accommodates up to 12" of final filter depth):
- Prefilter and either 6" or 12" cartridge filters at 60% to 65%, or 80% to 85%, or 90% to 95% efficiency

- 28" high efficiency filter section (accommodates up to 21" of final filter depth):
- Prefilter and 21" bag filters at 60-65%, or 80-85%, or 90-95% efficiency

- 44", high efficiency filter section (accommodates up to 37" of final filter depth):
- Prefilter and 30" bag filters at 60% to 65%, or 80% to 85%, or 90% to 95% efficiency
- OR prefilter and thirty-seven inch bag filters at 60% to 65%, or 80% to 85%, or 90% to 95% efficiency

High efficiency filter section options:

- 1" depth by 3/4 lbs per cu. ft. density fiber glass insulation (standard section not insulated)
- Diffuser section, must be used when high efficiency filter section is downstream of fan (blow-through unit)
- Double wall construction on high efficiency filter section, adds 4" to the width and 2" to the height of the unit.
Insulation is 2" depth and 1.5 lbs per cu. ft. fiberglass. The insulation is sandwiched between standard unit and outer skin.

Auxiliary Sections- All unit Sizes:

(Dimensions, Page 29 to 37)

- Mixbox section, without dampers, with top, bottom, or back inlet openings,

- HCS type coil module, includes insulation, drain pan and four mounting legs, 15.5" max coil depth, see page 38.
- HCL type coil module, includes insulation, drain pan and four mounting legs, and more coil depth, see page 38.

- internal face and bypass sections, must be used with small coil for air bypass. See page 8.
- external face and bypass section, must be used with HCL type coil section or module. See page 8.

- Insulated access section, same size as high capacity filter section, hinged and latched doors, both sides.
- Uninsulated access section, same size as high capacity filter section, hinged and latched doors, both sides.

Accessories for Fan and Coil Sections

Fan Section Accessory:

	Available on:
Forward curved blower for total static of 3.5" to 6"	.Models 03 - 18 for all cabinet styles
Internal spring isolation (discharge arrangement 2 and 3 only)	.All models except size 14 and VCS cabinets
Internal spring isolation (discharge arrangement 2, 3, 4, 5 only)	.All VCS cabinets except size 14
Inlet vanes (does not include damper motor), forward curve (FC)	.Models 20 - 41 for all cabinet styles
Inlet vanes (does not include damper motor), air foil (AF) fan	.Models 20 - 75 for all cabinet styles
Dual drive (extended shaft blowers with motors and drives installed on each side of fan, select 2 motors and 2 drives)	.Models 20 - 75 for all cabinet styles

Coil Section Accessory:

	Available on:
Large face area and small face area coils (see pages 42 & 43)	.All HCS, HCL, HD, and VCS coil cabinets
Balancing dampers above small coil (to adjust air flow over coil in the field)	.All HCS, HCL, HD, and VCS cabinets
Blank off plate above small sized coil (to force entire air flow over coil)	.All HCS, HCL, HD, and VCS cabinets
Stainless steel drain pan (in coil sections)	.All HCS, HCL, HD, and VCS coil cabinets
Coil section access door (standard section has removable panels)	.All HCL and VCS coil cabinets
Coil spacer, a preheat coil can be spaced apart from a cooling coil with a coil spacer, the spacer prevents air bypass around the downstream coil. The standard spacer is 6" wide and is furnished with a 4" x 6" removable inspection plate. See below for reheat coil.	.All HCL and VCS coil cabinets
Mount reheat coil to leaving air side of section (see page 38)	.All HCL and VCS coil cabinets

Gaskets

	Available on:
Gaskets between sections	.All HCS, HCL, HD, and VCS cabinets
Gaskets between sections and gasketed panels (outdoor application)	.Available on all five cabinets

Double Wall:

Double wall construction, adds 4" to the width and 2" to the height and length of cabinet. Insulation is 2" of fiberglass at 1.5 lbs per cubic foot density.
The insulation is sandwiched between the standard unit and the outer skin.

Available on all five
fan and coil cabinets

Available Motors, Drives, Motor Starters per Horsepower

Motors are three phase, ball bearing, rigid base and belt duty.

‘A’ = Available

Motor Description	Drive*	Starter	Motor Horsepower											
			1	1.5	2	3	5	7.5	10	15	20	25	30	40

Motor starter at 200-208/3/60, 120 volt holding coil	A	A	A	A	A	A	A	A	A	A				

* The percentage means the belts can handle an extra 20% or 50% BHP.

1. Air handler selections vary with each application. Use the index below to find Heatcraft Products air handler performance tables for:
 - Standard comfort cooling (either direct expansion or chilled water)
 - Heating (either steam or hot water, either make up air or return air)
 - Supermarket air conditioning (direct expansion refrigerant)
 - Heat reclaim (coil performance, refrigerant condenser, typically supermarket)
2. The air handler performance tables give ARI ratings for the specific applications, conditions and coils listed. All performance tables (except reclaim) rate: 10 FPI coils at 500 FPM coil air velocity.
To select air handlers for other applications, conditions, or components:
 - Call your representative. With your representative, you can have specific computer selected coils rated for your job conditions.
 - Use tables on pages 21 to 23 for estimates of coil performance at various conditions.
3. See page 12, step 5 to calculate total static pressure. Consult fan tables, pages 24 to 29 and select fan motor.
4. Heatcraft builds each air handler to your components specifications.
Please specify the following as needed with your order:
 - CFM
 - External or total static pressure
 - Motor HP, motor type, motor voltage, motor location (left hand or right hand)
 - Describe coils or specify with Heatcraft Products model numbers.

Coil description can include:

 - Rows, FPI, refrigerant, design capacity (BTUH),
 - Number of circuits, coil location inside air handler (preheat, reheat, etc.)
 - Location of coil connections (left hand or right hand)
 - Filter sections and filter types
 - Vibration isolators
5. Go to page 12 for air handler selection example.

* Steam coils for model sizes 65 and 75 have a 1" tube diameter.

Selection Example

Air Handler Selection Conditions:

"I want a ceiling mounted air handler that gives 35 tons of cooling and 35 tons of heating. I have 44°F. water for cooling and I have 200°F. water for heating. My entering air temperatures on the coil are standard, that is 80°F. dry bulb and 67°F. wet bulb (50% relative humidity) for cooling. For heating, the entering air temperature is 60°F. I will supply duct work, you should select the motor to handle a half inch of external static pressure. Select the smallest air handler possible and tell me what kind of CFM, flow rates, fluid pressure drops, and sensible cooling performance your selection will give me. I want a filter too."

Selection Procedure:

1. Which air handler for cooling performance?

Look at index of air handler performance on page 11. Find that tables 6 through 9 give chilled water performance.

You need 35 tons or $35 \times 12 =$ 420 MBH

Compare 1/2" and 5/8" and 4 row and 6 row performance:

Select size 20 air handler with six row 1/2" tube coil with capacity of:	430	MBH
Note that 4 row 5/8" tube coil is not enough at:	374	MBH

2. Which air handler for heating performance?

Look at index of air handler performance on page 11. Find that tables 12 & 13 are for hot water performance with 60°F. air.

You need 35 tons or $35 \times 12 =$ 420 MBH

Compare 1/2" and 5/8" and 1 row and 2 row performance:

Select one row 5/8" tube coil for size 20 air handler with capacity of:	502	MBH
Note that 1 row 1/2" tube coil is much too small at capacity of	395	MBH

3. Comparing steps 1 & 2, select:

Size 20 air handler at 10025 CFM with
6 row, 1/2" tube chilled water coil with
1 row, 5/8" tube hot water coil.

4. Look at page 38, "Characteristics of standard coil sections" and confirm that:

1 row depth coil casing:	3.25	inches
+ 6 row depth coil casing:	+9.75	inches
Total	13.00	inches fits into HCS type cabinet

5. Look at page 40 & 41, "Air pressure drop tables" and calculate total pressure drop:

0.17 inch	Pressure drop through 1 row coil, see dry 5/8" tube at: 10025 Divided By 19.25 = 521 FPM
0.79 inch	Pressure drop through 6 row coil see wet 1/2" tube at: 500 FPM
0.22 inch	Pressure drop for flat filter section, pleated 2" filter at: 10025 Divided By 24.4 = 411 FPM
+0.50 inch	External static pressure
<u>1.68</u> inch	Total static pressure

6. Look at page 27, "Fan performance":

Select a 5 HP motor for the condition of 10000 CFM and less than 1.75 inches of water.

7. Air handler description and performance:

Description:	Performance:
HCS model size 20	10025 CFM at 1.68" total static and 0.5" external static pressure
with 6 row 10FPI, type A, cooling coil	430 MBH total cooling capacity and
with 1 row 10 FPI, type 5, heating coil	292 MBH sensible cooling capacity with
with open 5 HP motor at 230/3/60 volts	80°F. DB/ 67°F. WB entering air and 44°F entering water at 85.8 GPM and 13.5 feet of fluid pressure drop
(See page 10)	502 MBH of heating capacity with 60°F. entering air and 200°F. entering water at 64.5 gpm and 12.3 feet of fluid pressure drop
with 120% adjustable drive	
with motor starter	
with flat filter section	
with 35% efficient 2" filters	
with (6) rubber in shear vibration isolators	
for ceiling mount (see page 38)	

8. To estimate performance of coils at other than 10 FPI, or different row depths, or different air speeds or temperature conditions see tables on page 20 - 23, or call your representative. With your representative, you can have specific computer selected coils for your job conditions.

Air Handler Performance - Quick Reference

Table 1

Heating and Cooling Performance for Selected Coils

At 500 FPM (2.54 m/s) and 10 FPI.

Notes

Note 1 - Air volume in CFM and cubic meters per hour for air speed of 500 fpm or 2.54 meter per second through a large face area 1/2" tube diameter (Type A) coil for each air handler model.
See pages 42 & 43 for range of air volumes for each model.

Note 2 - Face area of large size 1/2" diameter tube coil for each air handler in square feet and square meters. 5/8" & 1" diameter tube coils have slightly smaller face areas. See page 42 & 43 for other coils.

Note 3 - Direct expansion halocarbon air conditioning in thousands of BTUH and kilowatts. Performance is for a 1/2" tube, 4 row, 10 FPI coil with 40°F. (4.4°C.) evaporating temperature and entering air temperatures at 80°F. (26.7°C.) dry bulb and 67°F. (19.4°C.) wet bulb. See pages 14, 15, and 21 for other coils and conditions.

Note 4 - Halocarbon refrigerant gas heat reclaim (thousands of BTUH and kilowatts). Performance is for a 1/2" tube, 3 row, 10FPI coil with a 50°F. TD (or 27.7 degrees centigrade of temperature difference) between entering air and condensing temperature. See page 20 for other coils and conditions.

Note 5 - Chilled water air conditioning in thousands of BTUH or kilowatts. Performance is for a 5/8" tube, 6 row, 10FPI coil with 44°F. (6.7°C.) entering water temperature. Entering air temperatures are 80°F. (26.7°C.) dry bulb and 67°F. (19.4°C.) wet bulb. The fluid pressure drop is less than 25 feet (0.76 kilogram per square centimeter) and the water velocity is less than 6 fps (1.83 meters per second). See pages 16, 17, and 22 for other coils and conditions.

Note 6 - Hot water heating performance in thousands of BTUH or kilowatts. Performance is for a 5/8" tube, 2 row, 10 FPI coil with 200°F. (93.3°C.) entering water temperature. The entering air temperature is 0°F. (-18°C.). The fluid pressure drop is less than 25 feet (0.76 kilogram per square centimeter) and the water velocity is less than 6 fps (1.83 meters per second). See pages 18, 19, and 23 for more coils.

Note 7 - Steam heating performance in thousands of BTUH or kilowatts. The coils are 5/8" tube, 1 row, and 10 FPI (coils for models 65 and 75 are 1" diameter tubes). The entering air temperature is 60°F. (15.6°C.) and the steam pressure is 5 psig (1.38 kilogram per square centimeter). See pages 18, 19, and 23 for other coils and conditions.

SST = Saturated Suction Temperature

MBH = BTU per Hour in Thousands

Sens. = Sensible Capacity

Face Area in square feet

All coils have single refrigerant distributors unless noted as below:

^ These selections require two circuits.

^^ These selections require three circuits.

* These selections require four circuits.

** To estimate performance of coils at other than 10 FPI or at other air speeds or with other refrigerant or air temperatures see page 21, or call your representative. With your representative, you can have specific computer selected coils rated for your job conditions.

Air Handler Performance- Chilled Water

GPM = Gallons per minute

PD = Water pressure drop in feet of water

MBH = BTU per Hour in Thousands

^ These selections have two circuits. All the other selections have a single circuit .

^^ All steam coils rated at 5 PSIG Steam.

** Steam selections for 65 and 75 are two circuits and are 1 inch diameter tube (Type 8).

* To estimate performance of coils at other than 10 FPI or at other air speeds or with other water or air temperatures or other steam pressures see page 23, or call your representative. With your representative, you can have specific computer selected coils rated for your job conditions.

Coil Performance- Heat Reclaim MBH/SQ FT

Heat Reclaim Coil Selection Example:

Select reclaim coil for Size 26 air handler at 13280 CFM, 344 MBH reclaimed at 45°F. Temperature Difference.

- A. Change the application's requirement at application's TD to adjusted requirement at 50°F. TD. Use Table 15:

$$344/0.9 = 382.2 \text{ MBH (adjusted)}$$

- B. Divide the adjusted MBH by the coil face area:

$$382.2 / 26.56 = 14.4 \text{ MBH (adjusted) per square foot}$$

- C. Find the coil air speed:

$$13280 / 26.56 = 500 \text{ fpm}$$

- D. Select coil rows and fins per inch from Table 16 at coil air speed and with enough MBH to meet the MBH (adjusted to 50°F. TD) per square foot figured in step B:

Select 3 row 8 fin per inch coil with capacity of 14.56 MBH per square foot at 50°F. TD.

For this application, capacity equals: $(14.56 \times 26.56 \times 0.9)$ or 348 MBH for size 26 at 45°F. TD.

- E. When ordering, please specify refrigerant type and the total heat of rejection for each reclaim circuit. Or specify the per cent of the total heat of rejection that is reclaimed for each circuit.

Table 15 Heat reclaim correction factor for temperature difference between air and refrigerant.

[^] Average water temperature = (entering water temp + leaving water temp) divided by 2.

** For type 5, at 5 PSIG, if (total MBH divided by 0.961) divided by coil tubes is more than to 50 LB per tube, the condensate loading may be too high. At higher pressures the condensate loading can be more than 50 LB per tube. Get a computer rating for the application.

Maximum ODP Motor Frame Size for Models 65 and 75 — 324T for Open Drip Proof Motor and 286T for TEFC Motor.

High Efficiency Filter Sections- Dimensions

UNIT SIZE	High Efficiency Filter Section Dimensions - inches	
	A Width	B Height
03	0	3 1/2
06	0	1/4
08	0	3
10	3/8	3
12	0	0
14	0	0
18	0	0
20	2 1/4	0
26	1 1/2	0
34	1 1/2	0
41	1 1/2	0
50	0	0
65	0	0
75	0	3 3/8

Notes:

1. The high efficiency filter housing has flanges on the entering and leaving air sides that match the Heatcraft Products accessory hole pattern (page 30).
 2. The access doors have gaskets. Access doors are located on both sides of the filter housing.
 3. Filter housing is manufactured from a minimum of 16 gauge steel.

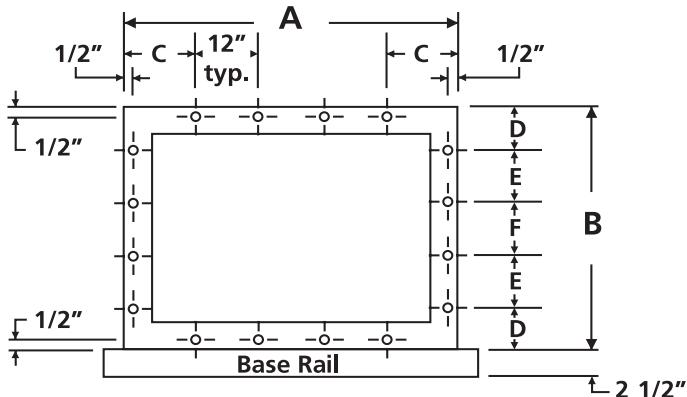

22" Section accommodates 2" prefilter and up to an additional 12" of high efficiency final filter

28" Section accommodates 2" prefilter and up to an additional 21" of high efficiency final filter

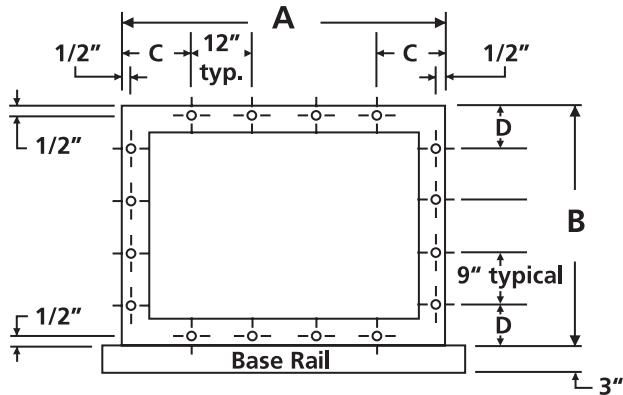

44" Section accommodates 2" prefilter and up to an additional 37" of high efficiency final filter

Accessory Flange Pattern

Sizes 03 - 18

Sizes 20 - 41

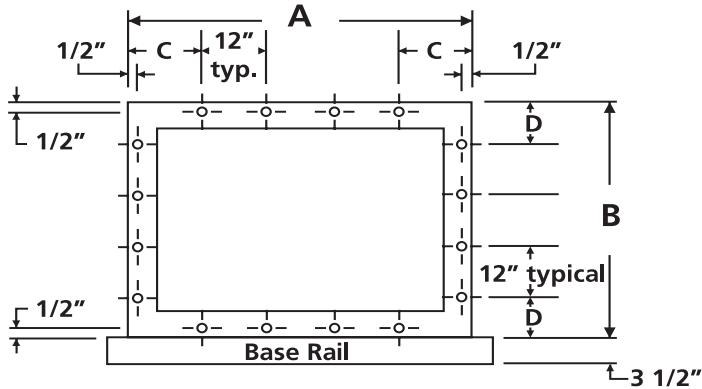

Flanges are 1" minimum all sections.

Size	Dimensions					
	A	B	C	D	E	F
03	37	22 3/4	1/2	2 3/8	9	—

34	115	54	3 1/2	4 1/2
41	115	65	3 1/2	5 1/2

Sizes 50 - 75

Flanges are 2", all sections.

Size	Dimensions			
	A	B	C	D
50	117 3/4	74 3/4	4 7/8	7 3/8
65	133 3/4	82 3/4	6 7/8	5 3/8
75	133 3/4	94 3/4	6 7/8	5 3/8

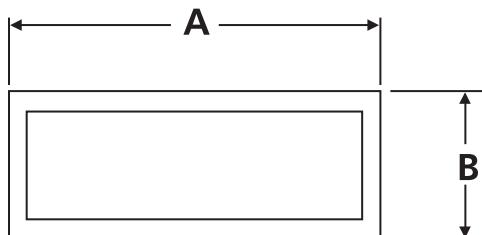

Notes - Sizes 03 Through 75:
Accessory hole patterns apply to both the
inlet and outlet of all the following sections:

- Coil sections.
- Flat and high efficiency filter sections.
- High capacity filter sections and Access sections.
- Internal face and bypass sections.

Accessory hole patterns apply to the:

- Inlet of fan sections.
- Inlet of external face and bypass sections.
- Outlet of economizer sections.

All dimensions are in inches.

AF = Airfoil Fan

+ Dimension "Q" is for Discharge Arrangement 2. For Discharge Arrangement 1, "Q" measures from corresponding side of unit.

^^ Arrangements 1 and 2 are not available with external face and bypass damper section.

Note: For double wall construction and internal isolation, please consult factory

(Coil weights include the weight of water when filled)

TA= Throw away type filters
AF= Airfoil Fan
FC= Forward Curved fan

Double wall construction add 45% to
fan & Coil section or accessory

To estimate weights for other coils:			
For Type A:		multiply type 5 coil weight by	0.800
For Small coil :		multiply large coil weight by	0.823
For 14 FPI:		multiply 10 FPI coil weight by	1.121
For 12 FPI:		multiply 10 FPI coil weight by	1.065
For 8 FPI:		multiply 10 FPI coil weight by	0.935
For 6 FPI:		multiply 10 FPI coil weight by	0.915

[^] The steam coils in models 65 and 75 are not type 5. They are type 8 coils with 1" diameter tubes on 3" centers.

* The CFM range for cooling and heating starts at a low of about 400 fpm through small coil . The maximum CFM for cooling is at no more than 550 fpm through a large coil. The maximum CFM for heating is at no more than 900 fpm through a large coil. The fan tables are on pages 24 through 29.

Fan Type

FC = Forward curve fan

AF = Airfoil fan

Shaft Diameter is inches

Bearings

(Ball Type)

C = Cartridge

PB = Pillow Block

Coils

FH X FL

FH = Finned Height , inches

FL = Finned Length, inches

TH = Tubes High

FACE AREA is in Square Feet.

Refrigerant can be either direct expansion, heat reclaim , or condenser coil.

Filters

1-24 X 24 Means one 24" by 24 " filter

[^] The steam coils in models 65 and 75 are not type 5. They are type 8 coils with 1" diameter tubes on 3" centers.

* The CFM range for cooling and heating starts at a low of about 400 fpm through small coil.

The maximum CFM for cooling is at no more than 550 fpm through a large coil. The maximum CFM for heating is at no more than 900 fpm through a large coil. The fan tables are on pages 24 through 29.

Fan Type
FC = Forward curve fan
AF = Airfoil fan
Shaft Diameter is inches

Bearings
(Ball Type)
C = Cartridge
PB = Pillow Block

Coils
FH X FL
FH = Finned Height , inches
FL = Finned Length, inches
TH = Tubes High
FACE AREA is in Square Feet.

Filters
1-24 X 24 Means one 24" by 24 " filter
Refrigerant can be either direct expansion, heat reclaim , or condenser coil.

Mechanical Specification

General

Provide a air handler of sound materials construction and design. Frame members, structural bases and all casings parts are fabricated from mill galvanized steel. The table on page 39 specifies the metal gauge of each component. Exterior panels are to be a minimum of 16 gauge galvanized steel. Access doors in the fan section provide complete access to motor(s), belts, drive(s) and fan. Removable casing panels in the coil section permit removal of coil from either side. Fan housings extend from the fan section panel for duct connections.

Air Conditioning Models - VCS, HCS, HCL

Provide a air conditioning air handler to meet cooling and condensate requirements. The air handler shall have standard insulation in both the fan and cooling coil sections with a drain pan as described below.

Cooling Coil Sections

Provide a air handler with a readily accessible and drainable coil section. Coil sections have removable panels on each side. Drain pan is of double wall construction with insulation sandwiched between the metal pans. Two (2) 1-1/4" FPT drain connections are supplied. These drain connections are furnished on each side of the drain pan on all sizes. Drain pans are #16 gauge galvanized steel. Provide standard insulation for the cooling coil section as described below.

Insulation

Provide the air handler with adequate insulation for air conditioning requirements. Standard Insulation is 1"-3/4# (1 inch thick, 3/4 lbs per cubic foot) fiberglass. Insulation is mat faced to prevent erosion. It meets the NFPA 90 Standard for flame spread and smoke generation.

Heating And Ventilating Models - HD

Provide a air handler to meet heating or ventilating (but no cooling) duty requirements. The standard heating unit includes 1 or 2 row heating sections. Furnish deeper coil sections for 3, 4, or 6 row coils. Do not insulate the fan or coil sections on these units.

Fans

Provide a air handler with fan section that meets air flow requirements. All units have been certified as complying with ARI Standard 430. All units have a single fan design (either forward curved or airfoil). The fans are statically and dynamically balanced in fan section before the unit leaves the factory. Fans and shafts operate well below the first critical speed. Fan bearings are ball bearing type selected for 200,000 hour average life. Low pressure LF fans - Sizes 03 through 12 have lifetime lubricated, rubber mounted, cartridge bearings. Unit sizes 14 through 75 have extended lube lines to the outside casing of the air handler on drive side.

Coils

Provide water heating, water cooling, steam heating, and direct expansion coils with ARI certification. All coils shall be of cartridge type, coils removable from either side of casing. Direct expansion coils are to be aluminum ripple corrugated plate fins on the staggered copper tubes. Fins shall have belled collars and shall be bonded to tubes by mechanical expansion. Maximum working pressure shall be 250 psig at 300°F. Coil shall be submerged in water for testing. Direct expansion coils shall be provided with pressure-type brass distributors with solder-type connections. All coils shall have a minimum of distributors, charged with dry air. Tubing for coils shall be copper with 1/2 or 5/8 inch outside diameters. Coils shall have suction and discharge connections on the same end. Heatcraft coil performance data is certified as complying with ARI Standard 410.

Filter Sections

Flat - Provide the air handler with an accessible flat filter section. Flat filter sections for 2 and 4 inch filters are available on all sizes. Access doors are furnished on both sides.

High Capacity - Provide the air handler with an accessible high capacity filter section. High capacity filter sections are for 2 inch filters. High capacity filter sections have one large door on each side.

High Efficiency - Provide the air handler with a high or a medium efficiency filter section. Units are constructed of 16 gauge galvanized steel. Fully gasketed doors are standard on each side of housing and units are fitted with positive pressure trip lock latches that assures a tight seal. Both 2 inch prefilter and one inch final filter tracks are extruded aluminum combined with reinforced nylon pile seal to create a corrosion resistant seal.

Economizer Section

Provide the air handler with an economizer with inlets options at the back, bottom, and top of the section. Economizer damper casing and blades shall be not less than 16 U.S. gauge galvanized steel. Each blade shall be die-formed, multi-break and not exceed 49 inches in length. Blades are to be mounted to a single square one half inch rod, to prevent linkage slip, extending the full length of the damper casing.

Face and Bypass Section

Dampers are opposed blade type. Shafts rotate in porous bronze bearings.

Access Section

Access sections have two hinged and latched doors, for all unit sizes. Access sections are not insulated as standard.
