The Single And Dual Compressor Vertical Air Discharge Condensing Units Feature Our Floating Tube™ Coil Design

Expanded (Locked) Auxiliary Tubes:

These tubes support the coil with fins and refrigerant carrying tubes. They do not carry refrigerant and are tightly fitted on end supports and center supports.

Free Floating Circuited Coil Tubes:

These tubes carry refrigerant and never touch the sheet metal end supports or center supports.

All CDV, CDVS, HDD and HDDS
units include a limited
Five Year Warranty
against condenser leaks at tube sheets
and center supports.

All condensers use the Floating Tube™ coil design to eliminate refrigerant leaks at the tube sheets. Additional tubes are added to the condenser coil. These tubes are expanded into the aluminum fins and condenser tube sheets. These anchor tubes support the weight of the coil, but are not a part of the refrigerant circuit.

The tubes in the refrigerant circuit are expanded into the fins, but “float” through oversized holes in the tube sheets. Tube sheet leaks are virtually eliminated, since the tubes which carry refrigerant never come in contact with the tube sheet.

The **intelliGen™ Refrigeration Controller** is a factory-mounted electronic control that delivers reliable operation and system performance. intelliGen helps reduce product spoilage by maintaining better temperature control and provides energy savings through optimizing defrosts.

Intuitive Design

The user interface design allows the operator to immediately know when and where there is a problem and provides the contractor a user-friendly interface to install and service the unit.

Simple Setup

System configuration quickly guides technicians through each step.

- Guided quick setup.
- No wiring between condensing unit and unit cooler, when controlling unit cooler only.
- Components factory mounted, tested, and calibrated.

Smart Servicing

Reduce diagnosis, service and downtime with intuitive user interface.

Remote Monitoring Capability

Field installable optional intelliGen Webserver Card (iWC) enables local and remote monitoring on any phone, tablet or laptop

- Optional intelliGen Integration Card (iIC) allows connection with Building Management System (BMS)

Adjustable Head Pressure Control

The Need For Head Pressure Control

Refrigeration condensing units must efficiently perform at varying ambient conditions. A properly sized unit will adequately perform at even the highest summer ambient temperatures. However, in situations where the system must operate the majority of the time at less than design temperature, a means of providing adequate head pressure for refrigerant flow is desirable. The CDV & HDD units have an adjustable head pressure method of head pressure control.

The Adjustable Head Pressure Control System

The Adjustable Head Pressure Control system is a factory assembled system utilizing an adjustable head pressure control to maintain a constant head pressure at the air-cooled condensing unit during all climatic conditions when the ambient temperature drops below 75°F (typical).

When the ambient is above 75°F, the condenser pressure is above the adjustable head pressure valve setting and therefore, the valve remains in the full open position.

As the temperature drops below 75°F, the pressure at the condenser also drops below the setting of the adjustable head pressure valve. The adjustable head pressure valve, sensing the reduction in condensing pressure, modulates toward the closed position, thus restricting the flow of liquid from the condenser. The liquid backs up into the condenser and floods a portion of the tubes, reducing the overall capacity of the condenser. The adjustable head pressure valve will continue to flood the condenser until the pressure setting has been reached, providing proper head pressure at all ambient temperatures.

While the condenser floods, a second line pressurizes the receiver through another valve; therefore, the refrigerant flow from the condenser to the receiver modulates with conditions. However, the bypass from the discharge line maintains a minimum receiver pressure. These valves are adjustable and the minimum receiver pressure may be reset higher or lower depending upon application situations of a particular job. The Adjustable Head Pressure Control system uses this two-valve, adjustable design.

Features & Benefits

The 12-40 HP single compressor vertical condensing units and 24-80 HP dual compressor vertical condensing units are designed to meet the needs of a demanding commercial and industrial refrigeration market. The product is configured to be flexible in its design and construction to allow it to respond to the requirements of refrigeration contractors, consulting engineers and facility owners/operators. The Floating Tube™ coil design incorporated in the product provides reliability against tube sheet leaks.

Cabinet & Construction

- All units feature the Floating Tube™ coil which eliminates tube sheet leaks
- Painted steel cabinet for superior strength and corrosion resistance
- Dual compressor models available in standard or parallel-piped configurations

Serviceability

- Manual pumpdown switch on all units
- Convenient access panels to easily service internal components
- Large electrical panel to facilitate ease of access

Energy Efficiency

- California Title 24 compliant when configured with available engineered-to-order options. Consult your Heatcraft Representative for applicable model specific options.

Quality

- Sight glass is easily viewable
- Fixed high and adjustable low pressure switch
- Refrigeration duty, rifled copper condenser tubing
- Piping is laid out to minimize stress and vibration and is pre-bent to eliminate braze joints, where possible, to reduce leak potential
- All joints are sweat type connections, no mechanical joints to leak
- Separate subcooling circuit in condenser for added capacity and vapor free liquid
- Pressure relief valve on receiver
- ServiceMate™ diagnostic module standard on all non-Beacon II™ condensing units

Components

Compressor

- Spring-mounted compressors with suction and discharge eliminators
- Receivers are sized for sufficient pumpdown capacity with inlet and outlet service valves

Motor

- Single compressor models available with Variable Speed EC (VSEC) Motors

Other

- Sight glass and permanent liquid line filter

Electrical Box Features

Single Compressor

Internal Piping

NOTES:

C*V=CDV is Adjustable Head Pressure Control, CDVS is intelliGen™/ Beacon II™

MCA = Minimum Circuit Ampacity

MOP = Maximum Overcurrent Protection

intelliGen™/ Beacon II™ and Air Defrost Units do not carry any of the evaporator fan or heater loads.

Power is supplied directly to the evaporators and does not go through the condensing unit.

An evaporator heater hold out relay (option) is recommended when two or more evaporators are connected to a single (CDV) condensing unit to allow termination on coils that have already defrosted to prevent unnecessary steaming.

This option is not needed on intelliGen™/ Beacon II™ (CDVS) systems wired for a Master / Slave operation. *Applies to Beacon II only.

Mounted Electric Defrost Kits for CDV condensing units include:

Defrost timer, terminal strip, (1) evaporator fan contactor and:

One (1) defrost heater contactor for 1L and 1H codes

Two (2) defrost heater contactors for 2L and 2H codes

Four (4) defrost heater contactors for 4L and 4H codes

Power is supplied to each intelliGen™/ Beacon II™ evaporator.

Each coil terminates its own defrost. Refrigeration will not start until all coils have terminated defrost.

Contact factory for 575 volt electrical specification.

NOTES:

C*V=CDV is Adjustable Head Pressure Control, CDVS is IntelliGen™/ Beacon II™

MCA = Minimum Circuit Ampacity

MOP = Maximum Overcurrent Protection

IntelliGen™/ Beacon II™ and Air Defrost Units do not carry any of the evaporator fan or heater loads.

Power is supplied directly to the evaporators and does not go through the condensing unit.

An evaporator heater hold out relay (option) is recommended when two or more evaporators are connected to a single (CDV) condensing unit to allow termination on coils that have already defrosted to prevent unnecessary steaming.

This option is not needed on IntelliGen™/ Beacon II™ (CDVS) systems wired for a Master / Slave operation. *Applies to Beacon II only.

Mounted Electric Defrost Kits for CDV condensing units include:

Defrost timer, terminal strip, (1) evaporator fan contactor and:

One (1) defrost heater contactor for 1L and 1H codes

Two (2) defrost heater contactors for 2L and 2H codes

Four (4) defrost heater contactors for 4L and 4H codes

Power is supplied to each IntelliGen™/ Beacon II™ evaporator.

Each coil terminates its own defrost. Refrigeration will not start until all coils have terminated defrost.

Contact factory for 575 volt electrical specification.
